The Sales Recovery Chart

This seasonally adjusted curve shows where current sales are as a percent of historic norms. The light blue area is when sales are below average, the light green area when they're above average. What is normal is calculated from sales over the years - 2016, 2017, 2018 and 2019. For example, at the height of the pandemic in January of 2021, sales were 59.4% above normal. Then sales fell to 34.8% below normal by January of 2023. As you can see unit sales improved this January and are now running 26.3% below normal.

The GPSR Desert Housing Report

January 2025

Summary

PRICES: The median price of a detached home in the Coachella Valley increased for the third straight month to \$689,753, which is \$30,753 above last year. The median attached price in the Valley was \$485,000, which is \$10,000 higher than last year. Year over year changes in the average size detached home price in each city vary widely and range from a gain of 17.4% in Coachella to a decline of 12.6% in Indian Wells. Gains of the average size attached home range from a gain of 24.6% in Indian Wells to minus 11.6% in Cathedral City.

SALES: Total three-month sales in the Valley are effectively unchanged from last year. The three month average this January was 506 units compared to 504 units a year ago. Sales are also about the same as last year in most cities. Palm Desert still has the highest unit sales at 114 per month, followed by Palm Springs with 101. Regional dollar sales in January were \$464 million, which is 10% above last year.

INVENTORY & “MONTHS OF SALES” RATIOS: On February 1st, Valley inventory was 3,389 units, which is 1,023 units more than last year. Inventory has been growing, and current numbers are now comparable to inventory levels before the pandemic. The Valley’s “months of sales” ratio was 5.6 months, which is 1.8 months more than last year. This fundamental ratio, which measures supply and demand, is now above pre-pandemic levels. While inventory has recovered, sales are 26% below normal, so supply is beginning to exceed demand.

DIM: At the end of January, the median number of “days in the market” in the Coachella Valley was 43 days, which is only two days more than last year. The city of Bermuda Dunes has the lowest average selling time at just 34 days. This is followed by Palm Springs at 39 days and Desert Hot Springs at 40 days. Coachella and La Quinta have the highest average selling time at 47 days. These historically short median selling times are keeping prices stable .

PRICE DISCOUNTS/PREMIUMS: Currently, detached homes are selling at an average discount of 2.6% compared to 2.2% a year ago. Attached homes are selling at a 2.9% discount. In general, cities with higher priced homes sell at larger discounts. Cathedral City has the smallest average discount at 1.2% while Palm Springs is selling homes with the highest average discount of 3.9%. In January, the percent of homes selling over list price was 10.8%, which is the norm long term.

Prices

The GPSR Desert Housing Report

January 2025

Coachella Valley Median Detached Home Price 23 Year Chart

Coachella Valley Median Detached Price

The median price of a detached home in the Coachella Valley increased for the third straight month to \$689,753. It's \$30,753 higher than last year. The median price usually hits its seasonal low between September and December, and that appears to be true again this year. The graph clearly shows that home prices, while making little progress over the last 2 1/2 years, remain stable.

The GPSR Desert Housing Report

January 2025

Coachella Valley Median Attached Home Price 23 Year Chart

Coachella Valley Median Attached Price

The median attached price in the Valley ended January at \$485,000, which is \$10,000 higher than last year. As the chart clearly shows, the seasonal price range for attached homes is much larger than that of detached homes, and prices seem to be following the normal seasonal pattern here, too.

The GPSR Desert Housing Report

January 2025

Price of Each City's Average Size Detached Home

City	Avg. Size Home	Pr. per sq/ft	Price of Avg. Size Home	Price One Year Ago	12 Month Change	2011-12 Price Low	% From Low
Coachella	1,700	\$296.35	\$503,795	\$429,276	17.4%	\$111,367	352.4%
Bermuda Dunes	2,200	\$326.09	\$717,398	\$612,656	17.1%	\$239,325	199.8%
La Quinta	2,200	\$406.12	\$893,464	\$851,928	4.9%	\$318,164	180.8%
Indio	2,200	\$293.43	\$645,546	\$617,694	4.5%	\$156,340	312.9%
Palm Springs	2,175	\$556.02	\$1,209,344	\$1,179,829	2.5%	\$323,879	273.4%
Palm Desert	2,200	\$342.78	\$754,105	\$736,120	2.4%	\$302,302	149.5%

Cathedral City	1,800	\$313.64	\$564,543	\$565,632	-0.2%	\$153,216	268.5%
Rancho Mirage	3,175	\$420.90	\$1,336,358	\$1,447,927	-7.7%	\$506,317	163.9%
Indian Wells	3,450	\$503.59	\$1,737,386	\$1,987,010	-12.6%	\$666,885	160.5%

Price of Each City's Average Size Attached Home

City	Avg. Size Home	Pr. per sq/ft	Price of Avg. Size Home	Price One Year Ago	12 Month Change	2011-12 Price Low	% From Low
Indian Wells	1,950	\$450.19	\$877,871	\$704,798	24.6%	\$259,126	238.8%
Bermuda Dunes	1,450	\$279.78	\$405,674	\$360,593	12.5%	\$89,117	355.2%
La Quinta	1,750	\$403.02	\$705,276	\$629,081	12.1%	\$247,713	184.7%
Palm Springs	1,250	\$375.45	\$469,313	\$461,688	1.7%	\$129,788	261.6%
Palm Desert	1,600	\$335.53	\$536,848	\$530,400	1.2%	\$197,896	171.3%
Rancho Mirage	1,775	\$316.90	\$562,498	\$562,782	-0.1%	\$211,030	166.5%
Indio	1,050	\$273.26	\$286,923	\$306,805	-6.5%	\$56,396	408.8%
Desert Hot Springs	750	\$171.01	\$128,258	\$138,930	-7.7%	\$16,013	701.0%
Cathedral City	1,250	\$235.15	\$293,938	\$332,531	-11.6%	\$80,544	264.9%

Price of The Average Size City Home

These two tables display the *price* and *price per square foot* of the average size home in each city. The average home size is listed in the second column and doesn't change. The latest price is then compared to the price a year ago. It's also compared to the all-time lows made in 2011. Year over year price changes in detached homes have a wide distribution, which range from a gain of 17.4% in Coachella to a decline of 12.6% in Indian Wells. Gains of the average size attached home range from 24.6% in Indian Wells to minus 11.6% in Cathedral City.

Unit and Dollar Sales

The GPSR Desert Housing Report

January 2025

Detached, Attached and Total Sales 3 month average

Monthly Sales – Three Month Average

Total three-month sales are effectively unchanged from last year. The three month average this January was 506 units compared to 504 units a year ago. Because of seasonality, it's difficult to determine where sales stand on a historical basis. The first chart in this report was designed to help distinguish seasonal changes from real ones. It shows that sales are below normal by 26.3%.

The GPSR Desert Housing Report

January 2025

Detached, Attached and Total Sales 12 month average

Monthly Sales – Twelve Month Average

The 12-month average of sales, which takes out seasonality, was 609 units a month. This long-term average is slightly less than last year and has been hovering just over 600 units a month now for almost two years. The Federal Reserve Board has finally begun to lower short term rates, but this hasn't done much to lower fixed mortgage rates, which are longer term.

The GPSR Desert Housing Report

January 2025

Home Sales by City 3 month average

Home Sales by City

Sales by city are now ranked left to right by highest average unit sales. Sales are about the same in most cities. Palm Desert still has the highest unit sales at 114, followed by Palm Springs with 101.

The GPSR Desert Housing Report

January 2025

Sales by Price Bracket

3 month average

Home Sales by Price Range

We've changed the price brackets to reflect the price increases of the last few years. The lowest bracket is now \$300,000 or lower, and there are now two brackets over \$1,000,000. The largest part of the overall sales decline appears to be sales of homes in one price bracket – from \$300K to \$399K. The rest are comparable.

The GPSR Desert Housing Report

January 2025

Coachella Valley Dollar Sales

New

Coachella Valley Dollar Sales (all homes)

This chart graphs dollar sales, averaged over three months, of all Coachella Valley home sales. The scale on the left is in millions of dollars. It shows the same seasonal pattern as the chart of three-month unit sales, except the relative highs and lows are different due to price changes over time. Dollar sales in January were \$464 million, which is 10% above last year.

The GPSR Desert Housing Report

January 2025

Home Sales by City

On this graph, cities are ranked left to right by greatest dollar sales. Since revenue depends on dollar sales more than unit sales, the numbers in this chart are better proxies for “revenue” than unit sales. Dollar sales appear to be comparable to last year in every city except Palm Desert and La Quinta where sales are measurably higher.

The GPSR Desert Housing Report

January 2025

Dollar Sales by Price Bracket

New

Home Sales by Price Range

This chart of dollar sales by price bracket shows a different pattern than unit sales by price bracket in the earlier chart. The large amounts in the two price brackets over a million dollars are accentuated more than the unit sales chart. In fact, dollar sales in these two brackets continue to account for 50% of all dollar sales in the Coachella Valley.

Inventory & “Months of Sales” Ratios

The GPSR Desert Housing Report

January 2025

Coachella Valley Housing Inventory (all homes)

Coachella Valley Total Inventory

On February 1st, Valley inventory was 3,389 units, which is 1,023 units more than last year. The seasonal pattern now suggests that inventory will begin an increase that usually carries through February. Inventory has been improving, and current numbers are now comparable to inventory before the pandemic.

The GPSR Desert Housing Report

January 2025

Inventory by City **New**

Inventory by City

This chart ranks Coachella Valley cities left to right by highest number of homes for sale. The dark colored bars are current listings, while the lighter colored bars are last year's number. This chart helps agents know what cities have homeowners with the greatest selling interest and how it compares to last year.

The GPSR Desert Housing Report

January 2025

Inventory by Price Bracket

New

Inventory by Price Bracket

This chart shows the number of homes selling in the different price brackets. Current numbers, shown by the dark colored bars, are compared to last year's numbers, shown by the lighter colored bars. The price brackets now include the two new brackets of homes priced over \$1,000,000. This chart helps locate what price brackets might be responsible for the growth or contraction of inventory.

The GPSR Desert Housing Report

January 2025

Coachella Valley "Months of Sales" Ratio

(based on average 12 month sales)

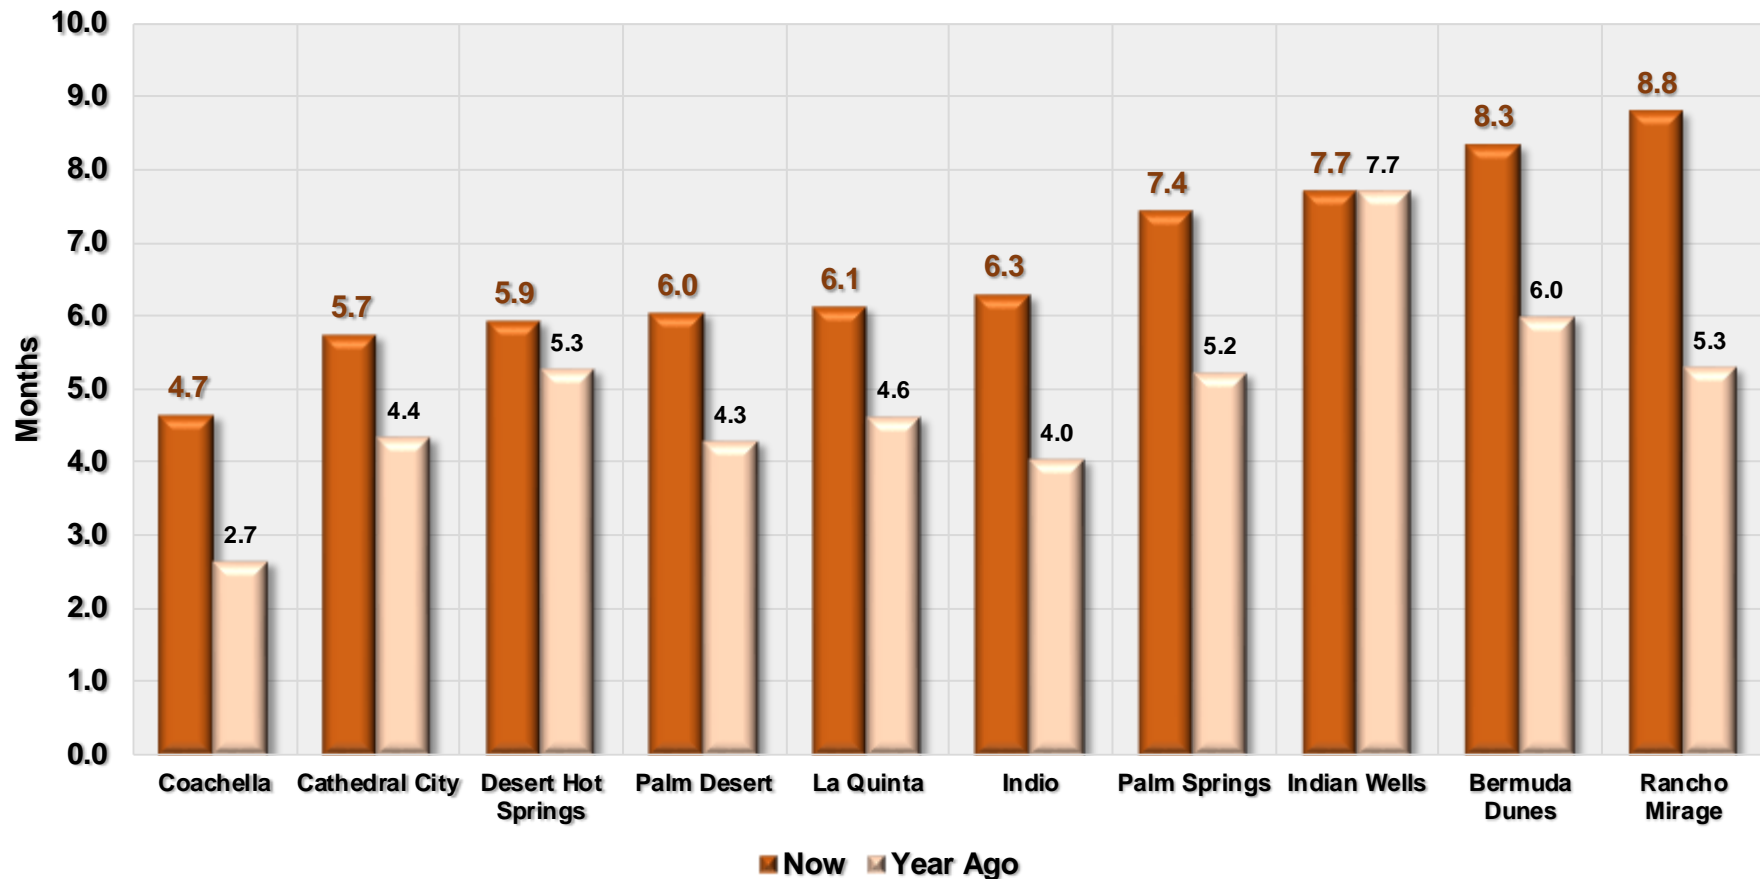

Regional "Months of Sales" Ratio

On February 1st, the Valley's "months of sales" ratio was 5.6 months, which is 1.8 months more than last year. As you can see, this fundamental ratio, which measures supply and demand, is now above pre-pandemic levels. While inventory has recovered with low sales supply is beginning to exceed demand. This should not cause a problem for home prices unless it begins to extend average selling times.

The GPSR Desert Housing Report

January 2025

"Months of Sales" by City

The "Months of Sales" Ratio by City

This chart ranks cities left to right by smallest number of "months of sales." The sales and inventory in these ratios include both attached and detached homes. We see consistent ratios between 6.0 and 7.0 months in most of the nine cities. The ratio in Rancho Mirage is now the highest at 8.8 months. Since "months of sales" is really the supply-demand equation for housing, it shows the housing market is becoming supply heavy. If the ratios move higher it will begin to increase selling times eventually putting downward pressure on home prices.

The GPSR Desert Housing Report

January 2025

"Months of Sales" by Price Bracket

The "Months of Sales" Ratio by Price Bracket

This chart shows "months of sales" by price bracket. The sales and inventory in the ratios includes both attached and detached homes. Since "months of sales" ratios are really the supply-demand equation for housing, the large increases over last year shows supply is starting to exceed demand in almost all price brackets. It hasn't affected prices yet and most probably won't until selling times begin to lengthen.

DIM & Price Premium/Discount

The GPSR Desert Housing Report

January 2025

Median DIM - Coachella Valley (all homes)

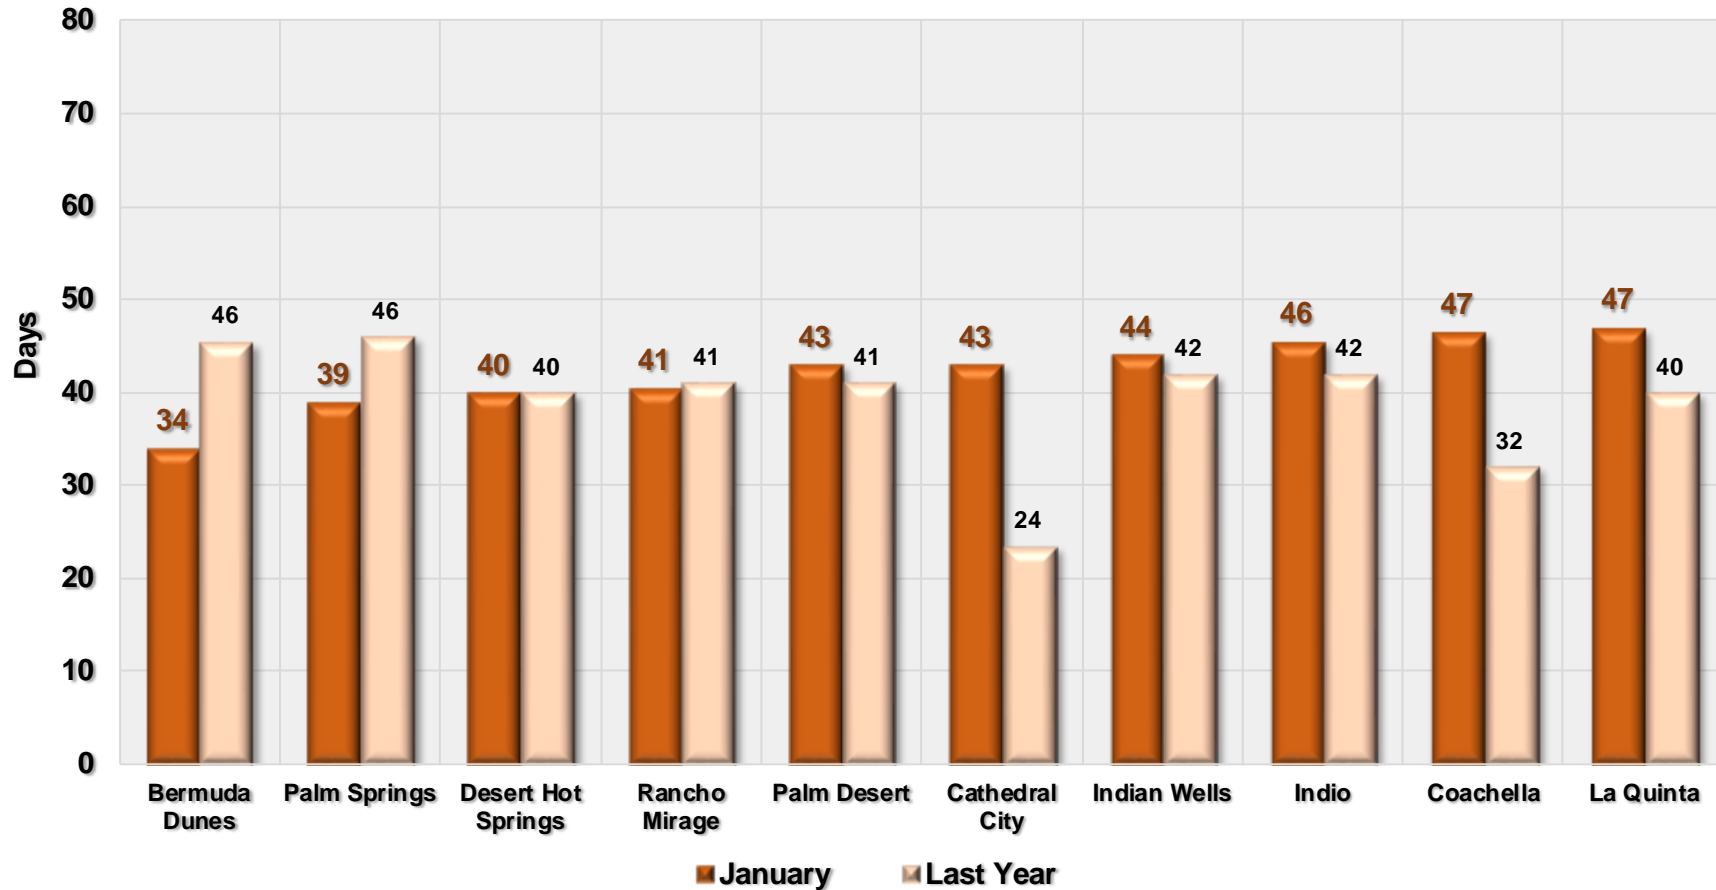

Regional “Days in the Market”

The median selling time in the region has been running between 40 and 50 days for two years. This includes both detached and attached homes. At the end of January, the median number of “days in the market” in the Coachella Valley was 43 days, which is only two days more than last year. These historically short median selling times help keep prices stable.

The GPSR Desert Housing Report

January 2025

Median DIM by City (all homes)

“Days in the Market” by City

This graph compares the median number of “days in the market” in each city to their ratios a year ago. The number includes both detached and attached homes. We have sorted the cities left to right by lowest number of days. The city of Bermuda Dunes has the lowest average selling time at just 34 days. This is followed by Palm Springs at 39 days and Desert Hot Springs at 40 days. Coachella and La Quinta have the highest average selling time at 47 days.

The GPSR Desert Housing Report

January 2025

Median DIM by Price Bracket (all homes)

New

“Days in the Market” by Price Bracket

This graph compares the median number of “days in the market” by price bracket to the ratio a year ago. The number includes both detached and attached homes. When looking at these numbers, it’s important to notice if any price bracket has an abnormal number of days. Usually, selling times increase with higher priced homes. However, in the current market we don’t see that, which is a positive situation.

The GPSR Desert Housing Report

January 2025

Coachella Valley Average Price Premium/Discount

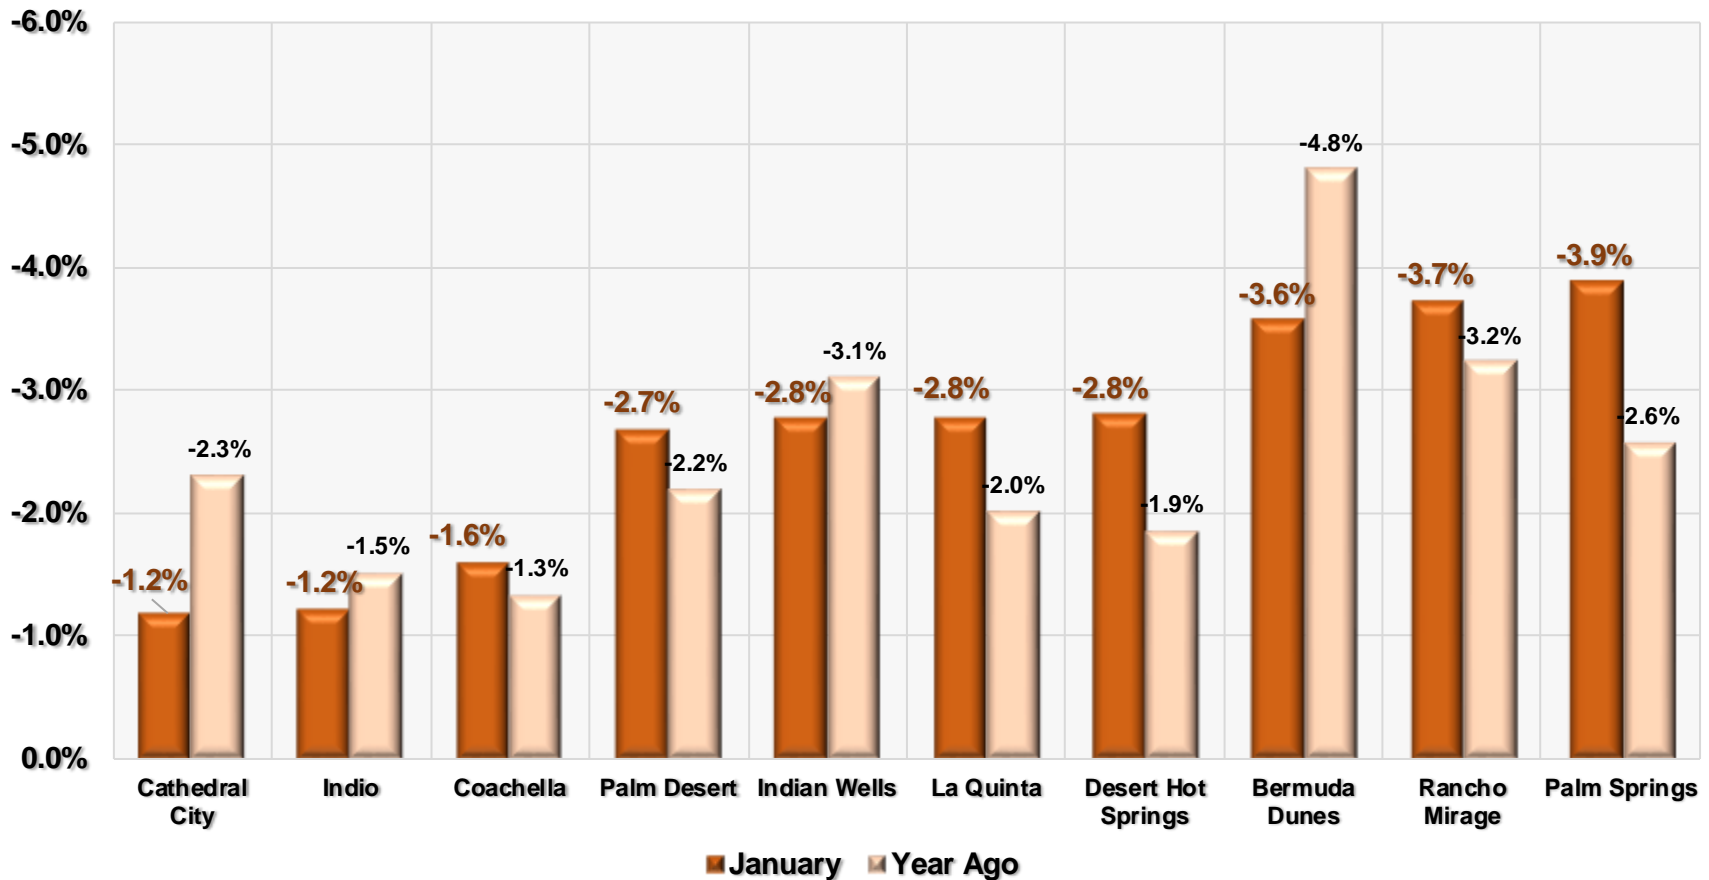

Regional Price Premium/Discount

This graph charts the average price premium or discount of detached and attached homes selling in the region. Currently, detached homes are selling at an average discount of 2.6% compared to 2.2% a year ago. Attached homes are selling at a 2.9% discount. Notice how the numbers for both detached and attached homes seem to move up and down together. We are now back to normal as numbers are in line with pre-covid levels.

The GPSR Desert Housing Report

January 2025

Average Selling Discount by City

Price Discount by City

This shows the average price discount for detached homes in each city to their ratios a year ago. We have sorted the cities left to right by lowest discount. In general, cities with higher priced homes sell at larger discounts. Cathedral City has the smallest average discount at 1.2% while Palm Springs is selling homes with the highest average discount of 3.9%.

The GPSR Desert Housing Report

January 2025

Average Selling Discount by Price Bracket

Price Discount by Price Bracket

This chart shows the average price discount by price bracket throughout the region compared to the discount a year ago. The average includes both detached and attached homes. As a rule, price discounts increase with higher priced homes, except here we have the lowest discounts in the mid range price brackets. Homes over two million dollars now sell with an average discount of 4.4%.

The GPSR Desert Housing Report

January 2025

Percent Homes Selling Over List Price (all homes)

Percent Homes Selling Above List

This chart graphs the percentage of Valley homes that sold above list price over the last three months. In January, the percent of homes selling over list price was 10.8%. This is 3.4% less than last year. The percent of homes selling above list price is now back to pre pandemic levels.

The GPSR Desert Housing Report

January 2025

Explanation and Description of Desert Housing Report's Calculations and Graphs

Regional Numbers: For the purposes of this report, the Coachella Valley consists of ten cities or CDPs – Bermuda Dunes, Cathedral City, the city of Coachella, Desert Hot Springs, Indian Wells, Indio, La Quinta, Palm Desert, Palm Springs and Rancho Mirage. Thousand Palms is excluded because it has too few sales for statistical meaning.

Regional sales and inventory numbers are the sum of sales or inventory in these 10 cities. Sales are averaged over either three or twelve months depending on the situation. The Coachella Valley median detached home price is the median price of all sales of single-family residences in the 10 cities over the prior 90 days (three months). The Coachella Valley Median Attached Price is the median price of sales of condos and townhomes over the past 90 days in all 10 cities. There are from 700 to 1,400 sales that go into these calculations, so they are statistically very reliable. The MLS data source is FLEX. Before any calculation is made, we first try to fix any incomplete or wrongly entered information.

City Prices: It is important that statistical analysis accurately reflects what one is trying to show. For example, calculating the median price of all sales in a city over three months, while called the “median” price, isn't really the median price of homes in that city. It's just the median price of the homes sold over that period. If larger homes sell that month, the medium price will go up, not because home prices are rising, but because you're analyzing a pool of larger, higher priced homes. We believe a better method exists to actual measure what is happening to home prices in a city. It centers around using price-per- square-feet.

A better metric to use is the median price-per-square-foot of homes sold over that time span. That's because this metric changes less than price, especially if, by chance, larger or smaller homes sell during a given period. The trouble is price per sq. ft. is not as consumer friendly as price. Homeowners think in terms of home price, they don't usually think in terms of price-per-square-foot. So, while median or average price-per-square-feet is good, we need a way to convert it into a home price that has meaning for that city.

To do this we first determine the average size home in that city. Once we know this, we multiply the median price-per-square-foot by this average size home. This is similar to the way appraisers value a home. Appraisers find the average or median price-per-square-foot of comparable size homes that have recently sold. They then multiply that number by the square feet of the home they're appraising. The table of city prices in this report follows this procedure.

In the table, the second column is the size of the average home in that city. This is not the average sq. ft. of the homes that sold. The number we use is determined after research and it's the average sq. ft. of all homes in the city, which we round off to the nearest 25 sq. ft. The exact number isn't important. What's important is that it's approximately correct and that you always use the same number.

The third column is the median price-per-square-foot of all homes sold in the city over the last 90 days.

The 4th column is the home price, which is calculated by multiplying column two by column three. This represents the price of the average size home in that city. For reasons which we explained, changes in this price are more reliable than changes in the normal “median” or “average” price of homes sold.

The GPSR Desert Housing Report

January 2025

Sales: For cities, sales numbers are the sum of sales of SFR, Condos and townhomes. We present two sales numbers – three-month average of sales and twelve-month averages. The three-month average shows the seasonal variations of the region. These three-month averages should only be compared against the same three months in previous years. For example, one should never compare three-month sales in spring to those of the fall. The twelve-month average of sales takes out all seasonality and is very useful when trying to assess the long-term growth or contraction of sales in the region and at the city level. In our calculations, three-month means sales over the preceding 90 days. Using 90 days gives equal time weight to shorter months.

Inventory and “Months of Sales”: Our inventory numbers are homes classified as “active” listings; we exclude listings called “active under contract.” We believe this is a more accurate measure of real supply since most “active under contract” listings will soon be closed sales. Remember sales and prices are accumulative while inventory is a momentary snapshot of available listings on a specific date. When we show month end inventory, it’s the inventory on the 1st of the next month. Our inventory is the sum of both attached and detached homes. We keep a record of past inventory downloads, so our past inventory is not reconstructed, which is prone to error, but is the actual inventory on that date.

When calculating the “months of sales” ratio, we almost always use average monthly sales over the last twelve months and not three months. If we do use three-month sales, we indicate it. We use the classic “months of sales ratio”, which is inventory divided by sales, and not its inverse called the “absorption rate.” Most people feel the ratio is much easier to understand.

Days in the Market and Sale Price Discount from List Price: These calculations are also the median value of the metrics reported from the MLS listing and are calculated over the last 90 days of transactions like price and sales. This is done to help reduce random variation and movements.

Call Out Numbers: The two numbers inserted in the charts are the most recent value(s) and the value(s) one year ago. Each number is connected to the point on the chart it refers to by a small thin line.
